THE UNIVERSITY OF CHICAGO
DEPARTMENT OF CHEMISTRY

1. The first part of the experiment is to determine the molar mass of a polymer. This is done by measuring the osmotic pressure of a solution of the polymer in a solvent. The osmotic pressure is measured by a method known as the membrane osmometry. The polymer solution is separated from a pure solvent by a semi-permeable membrane. The osmotic pressure is the pressure that must be applied to the pure solvent to prevent it from flowing through the membrane into the polymer solution.

2. The second part of the experiment is to determine the degree of substitution of a polymer. This is done by measuring the change in the refractive index of a solution of the polymer in a solvent. The refractive index is measured by a method known as the refractometry. The refractive index is the ratio of the speed of light in a vacuum to the speed of light in a medium.
